Culture Media Information

Prepared Media: Remel products from Thermo Fisher Scientific include more than 1700 media formulations and formats. Remel Prepared Media are used for the isolation and/or differentiation of microorganisms from samples or specimens. Most are ready for immediate use, with no further preparation necessary. Thermo Fisher Scientific also manufactures media on a contract basis and on a proprietary basis for our customers. Products designated as “Not Intended For IVD Use” have not been cleared by the FDA for In Vitro Diagnostic Use.

Dehydrated Media: Thermo Fisher Scientific Dehydrated Culture Media are used in our plated and tubed media formulations to ensure that you receive the best media possible. Each raw material component is pre-tested before being used to manufacture the finished product. Each medium is tested against a battery of organisms to assure that the medium performs as it should. Each lot of dehydrated culture medium is tested against the previous lot number to assure uniformity and consistency from lot to lot.

Animal Blood: We maintain a sheep farm to ensure the highest standards possible for the quality of animal blood used in Thermo Fisher Scientific Remel Products.

Components: All animal components used in the manufacture of Thermo Fisher Scientific Remel Products are of United States origin, or are imported in compliance with USDA/APHA regulations. Imported components are certified by the suppliers to be from countries that are BSE-free.

Quality Assurance: We adhere to the latest FDA Quality Systems Regulations (QSR). In many instances, we have exceeded those guidelines and established more stringent procedures to ensure the integrity of our products.

The Clinical and Laboratory Standards Institute (CLSI) has developed a standard specifying the requirements for quality assurance testing of culture media for the clinical laboratory, “Quality Control for Commercially Prepared Microbiological Culture Media,” M22-A.¹

All lot numbers of Thermo Fisher Scientific Remel Products have been tested using quality control

organisms which are listed on each IFU (Information For Use) sheet and/or Certificate of Quality for that specific product and have been found to meet or exceed guidelines. The quality control organisms used are derived from ATCC®* strains specified in the current CLSI Approved Standard¹ and/or standard reference method. Additional quality control organisms are often used to validate the performance of a specific medium.

Recording lot numbers and expiration dates of media received, or the retention of Remel’s packing slip included with each delivery, meets the CLSI guidelines for lot specific quality control and is recommended for inclusion in your laboratory’s quality control program. Certificates of Quality are available upon request. We should be notified of any deficiency so that appropriate action can be taken.

Providing the best quality control program possible is our priority. Quality control procedures are continually updated to reflect the current CLSI guidelines or standard reference methods. When you receive Remel media, you can be assured that the product will give you proper performance when stored and used as directed.

Technical Manual: We have developed a Technical Manual to ensure the user that quality control conforms with or exceeds CLSI standards. The Thermo Fisher Scientific Remel Products Technical Manual contains technical information for all prepared media, including those found on Table 3 in CLSI guideline M22-A¹.

Storage: Prepared media should be stored according to the package label until ready to use. Refrigerated media should be allowed to equilibrate to room temperature before use. Media containing dyes and blood should be protected from the light. Prepared media should not be used past its expiration date or if any visible damage or deterioration has occurred.

Distribution: We maintain a network of distribution facilities to provide you with dependable, rapid, convenient delivery.

Packaging: Plated Media are supplied in packages of ten, fifteen, twenty, forty, and one hundred. Please refer to the catalog to determine specific packaging

for each product. We use several types of plastic dishes for Prepared Plated Media. The first two digits of the REF number indicate the container or media Type. See chart below:

Monoplate: The 15 x 60mm, 12 x 85mm, 10 x 100 mm, 15 x 100 mm, or 15 x 150 mm plates contain one type of medium in the plate. Plates, except 15 x 60 mm, have stacking rings which interlock to minimize sliding of plates.

Biplate: 12 x 85 mm plate divided into two sections containing one medium on both sides or two media, one on each side.

Triplate: 12 x 85mm plate divided into three sections containing one medium in all three sections or different media in each section.

Quadplate: 12 x 85mm plate divided into four sections containing one medium in all four sections or different media in each section.

Individually Wrapped Plate: Plated media in monoplates, biplates, triplates or quadplates packaged in a sealed individual Tyvek® bag. Provides an extended expiration date.

150mm Plate: Plated media used primarily for antimicrobial susceptibility testing.

Contact Plate: 10 x 60 mm plated media used for surface sampling for microbial contamination. The plate contains agar which is above the edge

of the plate so it can be inverted and the agar placed on a surface. The plate also contains a grid on the bottom surface to aid in counting colonies of microorganisms growing on agar surface after incubation. Selected contact plates feature the GripFit™ lid technology engineered to ensure the lid remains in place during handling and yet can be easily removed during environmental monitoring.

JEMBEC Plate: A rectangular shaped plate with a circular reservoir which holds a CO₂ generating tablet. This plate is capable of providing a carbon dioxide atmosphere while the specimen is in transit.

Pill-Pocket Plate: A 15 x 100 mm circular plate with a reservoir for a CO₂ generating tablet. Provides a carbon dioxide atmosphere while specimen is in transit.

IDENTIFICATION AND SUSCEPTIBILITY TESTS

The Sensititre semi-automated system includes the Vizion with SWIN software, OptiRead and Sensititre AIM.

The Sensititre AIM System quickly and accurately doses most 96-well plates, eliminating skipped wells.

The OptiRead uses fluorescence technology to automate reading of Sensititre MIC plates.

The ARIS 2X provides full automation with no reagent additions, requiring less maintenance.

Any kit (assay) with a "S" or "SB" suffix would use the PF0889S product code.

Any kit (assay) with a "L" or "LB" suffix would use the PF0889L product code.

If planning on using a mixture of kits (assays) with a "S", "SB", "L", and "LB" suffix then the PF0889C is the proper Product Code to use.
